- 1 Find all real numbers  $p$  such that the equation

$$\sqrt{x^2 - 5p^2} = px - 1$$

has a root  $x = 3$ . Then, solve the equation for the determined values of  $p$ .

- 
- 2 Consider a (right) square pyramid  $ABCDV$  with the apex  $V$  and the base (square)  $ABCD$ . Denote  $d = AB/2$  and  $\varphi$  the dihedral angle between planes  $VAD$  and  $ABC$ .
- (1) Consider a line  $XY$  connecting the skew lines  $VA$  and  $BC$ , where  $X$  lies on line  $VA$  and  $Y$  lies on line  $BC$ . Describe a construction of line  $XY$  such that the segment  $XY$  is of the smallest possible length. Compute the length of segment  $XY$  in terms of  $d, \varphi$ .
- (2) Compute the distance  $v$  between points  $V$  and  $X$  in terms of  $d, \varphi$ .

- 
- 3 Find all real numbers  $\alpha$  such that both values  $\cot(\alpha)$  and  $\cot(2\alpha)$  are integers.

- 
- 4 Consider a non-zero convex angle  $\angle POQ$  and its inner point  $M$ . Moreover, let  $m > 0$  be given. Construct a trapezoid  $ABCD$  satisfying the following conditions:
- (1) vertices  $A, D$  lie on ray  $OP$  and vertices lie on ray  $OQ$ ,
- (2) diagonals  $AC$  and  $BD$  intersect in  $M$ ,
- (3)  $AB = m$ .
- Prove that your construction is correct and discuss conditions of solvability.
-
