1 Pooki Sooki has 8 hoodies, and he may wear any of them throughout a 7 day week. He changes his hoodie exactly 2 times during the week, and will only do so at one of the 6 midnights. Once he changes out of a hoodie, he never wears it for the rest of the week. The number of ways he can wear his hoodies throughout the week can be expressed as $\frac{8!}{2^{k}}$. Find $k$.

Proposed by Minseok Eli Park (wolfpack)
2 Akshar is reading a 500 page book, with odd numbered pages on the left, and even numbered pages on the right. Multiple times in the book, the sum of the digits of the two opened pages are 18 . Find the sum of the page numbers of the last time this occurs.

Proposed by Minseok Eli Park (wolfpack)
3 Define $S(N)$ to be the sum of the digits of $N$ when it is written in base 10 , and take $S^{k}(N)=$ $S(S(\ldots(N) \ldots))$ with $k$ applications of $S$. The stability of a number $N$ is defined to be the smallest positive integer $K$ where $S^{K}(N)=S^{K+1}(N)=S^{K+2}(N)=\ldots$. Let $T_{3}$ be the set of all natural numbers with stability 3 . Compute the sum of the two least entries of $T_{3}$.

Proposed by Albert Wang (awang11)
4 Consider all possible pairs of positive integers $(a, b)$ such that $a \geq b$ and both $\frac{a^{2}+b}{a-1}$ and $\frac{b^{2}+a}{b-1}$ are integers. Find the sum of all possible values of the product $a b$.

Proposed by Akshar Yeccherla (TopNotchMath)
5 Positive reals $a, b, c \leq 1$ satisfy $\frac{a+b+c-a b c}{1-a b-b c-c a}=1$. Find the minimum value of

$$
\left(\frac{a+b}{1-a b}+\frac{b+c}{1-b c}+\frac{c+a}{1-c a}\right)^{2}
$$

Proposed by Harry Chen (Extile)
6 In triangle $\triangle A B C$ with $B C=1$, the internal angle bisector of $\angle A$ intersects $B C$ at $D . M$ is taken to be the midpoint of $B C$. Point $E$ is chosen on the boundary of $\triangle A B C$ such that $M E$
bisects its perimeter. The circumcircle $\omega$ of $\triangle D E C$ is taken, and the second intersection of $A D$ and $\omega$ is $K$, as well as the second intersection of $M E$ and $\omega$ being $L$. If $B$ lies on line $K L$ and $E D$ is parallel to $A B$, then the perimeter of $\triangle A B C$ can be written as a real number $S$. Compute $\lfloor 1000 S\rfloor$.

Proposed by Albert Wang (awang11)
7 Three cats-TheInnocentKitten, TheNeutralKitten, and TheGuiltyKitten labelled $P_{1}, P_{2}$, and $P_{3}$ respectively with $P_{n+3}=P_{n}$-are playing a game with three rounds as follows:

- Each round has three turns. For round $r \in\{1,2,3\}$ and turn $t \in\{1,2,3\}$ in that round, player $P_{t+1-r}$ picks a non-negative integer. The turns in each round occur in increasing order of $t$, and the rounds occur in increasing order of $r$.
- Motivations: Every player focuses primarily on maximizing the sum of their own choices and secondarily on minimizing the total of the other players sums. TheNeutralKitten and TheGuiltyKitten have the additional tertiary priority of minimizing TheInnocentKittens sum.
- For round 2, player $P_{2}$ has no choice but to pick the number equal to what player $P_{1}$ chose in round 1. Likewise, for round 3, player $P_{3}$ must pick the number equal to what player $P_{2}$ chose in round 2.
- If not all three players choose their numbers such that the values they chose in rounds 1,2,3 form an arithmetic progression in that order by the end of the game, all players' sums are set to -1 regardless of what they have chosen.
- If the sum of the choices in any given round is greater than 100 , all choices that round are set to 0 at the end of that round. That is, rules 2,3 , and 4 act as if each player chose 0 that round.
- All players play optimally as per their motivations. Furthermore, all players know that all other players will play optimally (and so on.)
Let $A$ and $B$ be TheInnocentKitten's sum and TheGuiltyKitten's sum respectively. Compute $1000 A+B$ when all players play optimally.
