1 Suppose $r \geq 2$ is an integer, and let $m_{1}, n_{1}, m_{2}, n_{2}, \ldots, m_{r}, n_{r}$ be $2 r$ integers such that

$$
\left|m_{i} n_{j}-m_{j} n_{i}\right|=1
$$

for any two integers $i$ and $j$ satisfying $1 \leq i<j \leq r$. Determine the maximum possible value of $r$.

Proposed by B Sury
2 Find all pairs of integers $(a, b)$ so that each of the two cubic polynomials

$$
x^{3}+a x+b \text { and } x^{3}+b x+a
$$

has all the roots to be integers.
Proposed by Prithwijit De and Sutanay Bhattacharya
3 Betal marks 2021 points on the plane such that no three are collinear, and draws all possible segments joining these. He then chooses any 1011 of these segments, and marks their midpoints. Finally, he chooses a segment whose midpoint is not marked yet, and challenges Vikram to construct its midpoint using only a straightedge. Can Vikram always complete this challenge?
Note. A straightedge is an infinitely long ruler without markings, which can only be used to draw the line joining any two given distinct points.
Proposed by Prithwijit De and Sutanay Bhattacharya
4 A Magician and a Detective play a game. The Magician lays down cards numbered from 1 to 52 face-down on a table. On each move, the Detective can point to two cards and inquire if the numbers on them are consecutive. The Magician replies truthfully. After a finite number of moves, the Detective points to two cards. She wins if the numbers on these two cards are consecutive, and loses otherwise.

Prove that the Detective can guarantee a win if and only if she is allowed to ask at least 50 questions.
Proposed by Anant Mudgal
5 In a convex quadrilateral $A B C D, \angle A B D=30^{\circ}, \angle B C A=75^{\circ}, \angle A C D=25^{\circ}$ and $C D=C B$. Extend $C B$ to meet the circumcircle of triangle $D A C$ at $E$. Prove that $C E=B D$.

## Proposed by BJ Venkatachala

$6 \quad$ Let $\mathbb{R}[x]$ be the set of all polynomials with real coefficients. Find all functions $f: \mathbb{R}[x] \rightarrow \mathbb{R}[x]$ satisfying the following conditions:

- $f$ maps the zero polynomial to itself,
- for any non-zero polynomial $P \in \mathbb{R}[x]$, $\operatorname{deg} f(P) \leq 1+\operatorname{deg} P$, and
- for any two polynomials $P, Q \in \mathbb{R}[x]$, the polynomials $P-f(Q)$ and $Q-f(P)$ have the same set of real roots.
