## Round 4

www.artofproblemsolving.com/community/c2383848 by jasperE3

– Day 1

**Problem 1** Five points are given in space, no four of which are coplanar. Each of the segments connecting two of them is painted in white, green or red, so that all the colors are used and no three segments of the same color form a triangle. Prove that among these five points there is one at which segments of all the three colors meet.

**Problem 2** Let *ABC* be a triangle such that the altitude *CH* and the sides *CA*, *CB* are respectively equal to a side and two distinct diagonals of a regular heptagon. Prove that  $\angle ACB < 120^{\circ}$ .

**Problem 3** A quadrilateral pyramid is cut by a plane parallel to the base. Suppose that a sphere S is circumscribed and a sphere  $\Sigma$  inscribed in the obtained solid, and moreover that the line through the centers of these two spheres is perpendicular to the base of the pyramid. Show that the pyramid is regular.

– Day 2

**Problem 4** Let *n* be an odd positive integer. Prove that if the equation  $\frac{1}{x} + \frac{1}{y} = \frac{4}{n}$  has a solution in positive integers *x*, *y*, then *n* has at least one divisor of the form 4k - 1,  $k \in \mathbb{N}$ .

**Problem 5** Find all positive values of *a*, for which there is a number *b* such that the parabola  $y = ax^2 - b$  intersects the unit circle at four distinct points. Also prove that for every such a there exists *b* such that the parabola  $y = ax^2 - b$  intersects the unit circle at four distinct points whose *x*-coordinates form an arithmetic progression.

**Problem 6** Planes  $\alpha$ ,  $\beta$ ,  $\gamma$ ,  $\delta$  are tangent to the circumsphere of a tetrahedron *ABCD* at points *A*, *B*, *C*, *D*, respectively. Line *p* is the intersection of  $\alpha$  and  $\beta$ , and line *q* is the intersection of  $\gamma$  and  $\delta$ . Prove that if lines *p* and *CD* meet, then lines *q* and *AB* lie on a plane.
