by jasperE3

– Day 1

---

**Problem 1** We are given the sequence  $a_1, a_2, a_3, \dots$ , for which:

$$a_n = \frac{a_{n-1}^2 + c}{a_{n-2}} \text{ for all } n > 2.$$

Prove that the numbers  $a_1, a_2$  and  $\frac{a_1^2 + a_2^2 + c}{a_1 a_2}$  are whole numbers.

---

**Problem 2**  $k_1$  denotes one of the arcs formed by intersection of the circumference  $k$  and the chord  $AB$ .  $C$  is the middle point of  $k_1$ . On the half line (ray)  $PC$  is drawn the segment  $PM$ . Find the locus formed from the point  $M$  when  $P$  is moving on  $k_1$ .

*G. Ganchev*

---

**Problem 3** On the name day of a man there are 5 people. The men observed that of any 3 people there are 2 that knows each other. Prove that the man may order his guests around circular table in such way that every man have on its both side people that he knows.

*N. Nenov, N. Hazhiivanov*

---

– Day 2

---

**Problem 4** Find the greatest possible real value of  $S$  and smallest possible value of  $T$  such that for every triangle with sides  $a, b, c$  ( $a \leq b \leq c$ ) to be true the inequalities:

$$S \leq \frac{(a + b + c)^2}{bc} \leq T.$$

**Problem 5** Prove that for every convex polygon can be found such three sequential vertices for which a circle that they lie on covers the polygon.

*Jordan Tabov*

---

**Problem 6** The base of the pyramid with vertex  $S$  is a pentagon  $ABCDE$  for which  $BC > DE$  and  $AB > CD$ . If  $AS$  is the longest edge of the pyramid prove that  $BS > CS$ .

*Jordan Tabov*

---
