by Amir Hossein

- 1 Prove that there exist infinitely many positive integers which can't be represented as sum of less than 10 odd positive integers' perfect squares.
- 
- 2 In the figure below, area of triangles  $AOD$ ,  $DOC$ , and  $AOB$  is given. Find the area of triangle  $OEF$  in terms of area of these three triangles.

- 
- 4 Prove that there exists a subset  $S$  of positive integers such that we can represent each positive integer as difference of two elements of  $S$  in exactly one way.
- 
- 5 In a convex quadrilateral  $ABCD$ , diagonals  $AC$  and  $BD$  are equal. We construct four equilateral triangles with centers  $O_1, O_2, O_3, O_4$  on the sides  $AB, BC, CD, DA$  outside of this quadrilateral, respectively. Show that  $O_1O_3 \perp O_2O_4$ .
- 
- 6 Let  $x_1, x_2, \dots, x_{12}$  be twelve real numbers such that for each  $1 \leq i \leq 12$ , we have  $|x_i| \geq 1$ . Let  $I = [a, b]$  be an interval such that  $b - a \leq 2$ . Prove that number of the numbers of the form  $t = \sum_{i=1}^{12} r_i x_i$ , where  $r_i = \pm 1$ , which lie inside the interval  $I$ , is less than 1000.
