## Day 1 July 24th

In the plane the points with integer coordinates are the vertices of unit squares. The squares are coloured alternately black and white (as on a chessboard). For any pair of positive integers m and n, consider a right-angled triangle whose vertices have integer coordinates and whose legs, of lengths m and n, lie along edges of the squares. Let  $S_1$  be the total area of the black part of the triangle and  $S_2$  be the total area of the white part. Let  $f(m, n) = |S_1 - S_2|$ .

a) Calculate f(m, n) for all positive integers m and n which are either both even or both odd.

b) Prove that  $f(m,n) \leq \frac{1}{2} \max\{m,n\}$  for all m and n.

c) Show that there is no constant  $C \in \mathbb{R}$  such that f(m, n) < C for all m and n.

2 It is known that  $\angle BAC$  is the smallest angle in the triangle ABC. The points B and C divide the circumcircle of the triangle into two arcs. Let U be an interior point of the arc between B and C which does not contain A. The perpendicular bisectors of AB and AC meet the line AU at V and W, respectively. The lines BV and CW meet at T.

Show that AU = TB + TC.

#### Alternative formulation:

Four different points A, B, C, D are chosen on a circle  $\Gamma$  such that the triangle BCD is not right-angled. Prove that:

(a) The perpendicular bisectors of AB and AC meet the line AD at certain points W and V, respectively, and that the lines CV and BW meet at a certain point T.

(b) The length of one of the line segments AD, BT, and CT is the sum of the lengths of the other two.

**3** Let  $x_1, x_2, \ldots, x_n$  be real numbers satisfying the conditions:

$$\begin{cases} |x_1 + x_2 + \dots + x_n| &= 1\\ |x_i| &\leq \frac{n+1}{2} & \text{for } i = 1, 2, \dots, n. \end{cases}$$

Show that there exists a permutation  $y_1, y_2, \ldots, y_n$  of  $x_1, x_2, \ldots, x_n$  such that

$$|y_1 + 2y_2 + \dots + ny_n| \le \frac{n+1}{2}.$$

#### Day 2 July 25th

**4** An  $n \times n$  matrix whose entries come from the set  $S = \{1, 2, ..., 2n - 1\}$  is called a *silver matrix* if, for each i = 1, 2, ..., n, the *i*-th row and the *i*-th column together contain all elements of *S*. Show that:

(a) there is no silver matrix for n = 1997;

- (b) silver matrices exist for infinitely many values of n.
- **5** Find all pairs (a, b) of positive integers that satisfy the equation:  $a^{b^2} = b^a$ .
- **6** For each positive integer n, let f(n) denote the number of ways of representing n as a sum of powers of 2 with nonnegative integer exponents. Representations which differ only in the ordering of their summands are considered to be the same. For instance, f(4) = 4, because the number 4 can be represented in the following four ways: 4; 2+2; 2+1+1; 1+1+1+1.

Prove that, for any integer  $n \ge 3$  we have  $2^{\frac{n^2}{4}} < f(2^n) < 2^{\frac{n^2}{2}}$ .
