### Day 1 July 24th

1	Let <i>n</i> be a positive integer. Each point $(x, y)$ in the plane, where <i>x</i> and <i>y</i> are non-negative integers with $x + y < n$ , is coloured red or blue, subject to the following condition: if a point $(x, y)$ is red, then so are all points $(x', y')$ with $x' \le x$ and $y' \le y$ . Let <i>A</i> be the number of ways to choose <i>n</i> blue points with distinct <i>x</i> -coordinates, and let <i>B</i> be the number of ways to choose <i>n</i> blue points with distinct <i>y</i> -coordinates. Prove that $A = B$ .
2	The circle <i>S</i> has centre <i>O</i> , and <i>BC</i> is a diameter of <i>S</i> . Let <i>A</i> be a point of <i>S</i> such that $\angle AOB < 120^{\circ}$ . Let <i>D</i> be the midpoint of the arc <i>AB</i> which does not contain <i>C</i> . The line through <i>O</i> parallel to <i>DA</i> meets the line <i>AC</i> at <i>I</i> . The perpendicular bisector of <i>OA</i> meets <i>S</i> at <i>E</i> and at <i>F</i> . Prove that <i>I</i> is the incentre of the triangle <i>CEF</i> .
3	Find all pairs of positive integers $m, n \ge 3$ for which there exist infinitely many positive integers a such that $\frac{a^m + a - 1}{a^n + a^2 - 1}$ is itself an integer.
	Laurentiu Panaitopol, Romania
Day 2	July 25th
4	Let $n \ge 2$ be a positive integer, with divisors $1 = d_1 < d_2 < \ldots < d_k = n$ . Prove that $d_1d_2 + d_2d_3 + \ldots + d_{k-1}d_k$ is always less than $n^2$ , and determine when it is a divisor of $n^2$ .
5	Find all functions $f$ from the reals to the reals such that
	(f(x) + f(z))(f(y) + f(t)) = f(xy - zt) + f(xt + yz)
	for all real $x, y, z, t$ .
6	Let $n \ge 3$ be a positive integer. Let $C_1, C_2, C_3, \ldots, C_n$ be unit circles in the plane, with centres $O_1, O_2, O_3, \ldots, O_n$ respectively. If no line meets more than two of the circles, prove that

$$\sum_{1 \le i < j \le n} \frac{1}{O_i O_j} \le \frac{(n-1)\pi}{4}.$$
