– Geometry

1 Let $ABCD$ be a cyclic quadrilateral. Let P, Q, R be the feet of the perpendiculars from D to the lines BC, CA, AB , respectively. Show that $PQ = QR$ if and only if the bisectors of $\angle ABC$ and $\angle ADC$ are concurrent with AC .

2 Three distinct points A, B , and C are fixed on a line in this order. Let Γ be a circle passing through A and C whose center does not lie on the line AC . Denote by P the intersection of the tangents to Γ at A and C . Suppose Γ meets the segment PB at Q . Prove that the intersection of the bisector of $\angle AQC$ and the line AC does not depend on the choice of Γ .

3 Let ABC be a triangle and let P be a point in its interior. Denote by D, E, F the feet of the perpendiculars from P to the lines BC, CA, AB , respectively. Suppose that

$$AP^2 + PD^2 = BP^2 + PE^2 = CP^2 + PF^2.$$

Denote by I_A, I_B, I_C the excenters of the triangle ABC . Prove that P is the circumcenter of the triangle $I_A I_B I_C$.

Proposed by C.R. Pranesachar, India

4 Let $\Gamma_1, \Gamma_2, \Gamma_3, \Gamma_4$ be distinct circles such that Γ_1, Γ_3 are externally tangent at P , and Γ_2, Γ_4 are externally tangent at the same point P . Suppose that Γ_1 and Γ_2 ; Γ_2 and Γ_3 ; Γ_3 and Γ_4 ; Γ_4 and Γ_1 meet at A, B, C, D , respectively, and that all these points are different from P . Prove that

$$\frac{AB \cdot BC}{AD \cdot DC} = \frac{PB^2}{PD^2}.$$

5 Let ABC be an isosceles triangle with $AC = BC$, whose incentre is I . Let P be a point on the circumcircle of the triangle AIB lying inside the triangle ABC . The lines through P parallel to CA and CB meet AB at D and E , respectively. The line through P parallel to AB meets CA and CB at F and G , respectively. Prove that the lines DF and EG intersect on the circumcircle of the triangle ABC .

Proposed by Hojoo Lee

- 6** Each pair of opposite sides of a convex hexagon has the following property: the distance between their midpoints is equal to $\frac{\sqrt{3}}{2}$ times the sum of their lengths. Prove that all the angles of the hexagon are equal.

- 7** Let ABC be a triangle with semiperimeter s and inradius r . The semicircles with diameters BC, CA, AB are drawn on the outside of the triangle ABC . The circle tangent to all of these three semicircles has radius t . Prove that

$$\frac{s}{2} < t \leq \frac{s}{2} + \left(1 - \frac{\sqrt{3}}{2}\right)r.$$

Alternative formulation. In a triangle ABC , construct circles with diameters BC, CA , and AB , respectively. Construct a circle w externally tangent to these three circles. Let the radius of this circle w be t .

Prove: $\frac{s}{2} < t \leq \frac{s}{2} + \frac{1}{2}(2 - \sqrt{3})r$, where r is the inradius and s is the semiperimeter of triangle ABC .

Proposed by Dirk Laurie, South Africa

– Number Theory

- 1** Let m be a fixed integer greater than 1. The sequence x_0, x_1, x_2, \dots is defined as follows:

$$x_i = \begin{cases} 2^i & \text{if } 0 \leq i \leq m-1; \\ \sum_{j=1}^m x_{i-j} & \text{if } i \geq m. \end{cases}$$

Find the greatest k for which the sequence contains k consecutive terms divisible by m .

Proposed by Marcin Kuczma, Poland

- 2** Each positive integer a undergoes the following procedure in order to obtain the number $d = d(a)$:

- (i) move the last digit of a to the first position to obtain the number b ;
- (ii) square b to obtain the number c ;
- (iii) move the first digit of c to the end to obtain the number d .

(All the numbers in the problem are considered to be represented in base 10.) For example, for $a = 2003$, we get $b = 3200$, $c = 10240000$, and $d = 02400001 = 2400001 = d(2003)$.

Find all numbers a for which $d(a) = a^2$.

Proposed by Zoran Sunic, USA

- 3 Determine all pairs of positive integers (a, b) such that

$$\frac{a^2}{2ab^2 - b^3 + 1}$$

is a positive integer.

- 4 Let b be an integer greater than 5. For each positive integer n , consider the number

$$x_n = \underbrace{11 \cdots 1}_{n-1} \underbrace{22 \cdots 2}_n 5,$$

written in base b .

Prove that the following condition holds if and only if $b = 10$: [i]there exists a positive integer M such that for any integer n greater than M , the number x_n is a perfect square.[/i]

Proposed by Laurentiu Panaitopol, Romania

- 5 An integer n is said to be *good* if $|n|$ is not the square of an integer. Determine all integers m with the following property: m can be represented, in infinitely many ways, as a sum of three distinct good integers whose product is the square of an odd integer.

Proposed by Hojoo Lee, Korea

- 6 Let p be a prime number. Prove that there exists a prime number q such that for every integer n , the number $n^p - p$ is not divisible by q .

- 7 The sequence a_0, a_1, a_2, \dots is defined as follows:

$$a_0 = 2, \quad a_{k+1} = 2a_k^2 - 1 \quad \text{for } k \geq 0.$$

Prove that if an odd prime p divides a_n , then 2^{n+3} divides $p^2 - 1$.

Hi guys ,

Here is a nice problem:

Let be given a sequence a_n such that $a_0 = 2$ and $a_{n+1} = 2a_n^2 - 1$. Show that if p is an odd prime such that $p|a_n$ then we have $p^2 \equiv 1 \pmod{2^{n+3}}$

Here are some futher question proposed by me :Prove or disprove that :

1) $\gcd(n, a_n) = 1$

2) for every odd prime number p we have $a_m \equiv \pm 1 \pmod{p}$ where $m = \frac{p^2-1}{2^k}$ where $k = 1$ or 2

Thanks kiu si u

Edited by Orli.

- 8** Let p be a prime number and let A be a set of positive integers that satisfies the following conditions:
- (i) the set of prime divisors of the elements in A consists of $p - 1$ elements;
 - (ii) for any nonempty subset of A , the product of its elements is not a perfect p -th power.
- What is the largest possible number of elements in A ?

– Algebra

- 1** Let a_{ij} $i = 1, 2, 3; j = 1, 2, 3$ be real numbers such that a_{ij} is positive for $i = j$ and negative for $i \neq j$.

Prove the existence of positive real numbers c_1, c_2, c_3 such that the numbers

$$a_{11}c_1 + a_{12}c_2 + a_{13}c_3, \quad a_{21}c_1 + a_{22}c_2 + a_{23}c_3, \quad a_{31}c_1 + a_{32}c_2 + a_{33}c_3$$

are either all negative, all positive, or all zero.

Proposed by Kiran Kedlaya, USA

- 2** Find all nondecreasing functions $f : \mathbb{R} \rightarrow \mathbb{R}$ such that
- (i) $f(0) = 0, f(1) = 1$;
 - (ii) $f(a) + f(b) = f(a)f(b) + f(a + b - ab)$ for all real numbers a, b such that $a < 1 < b$.

Proposed by A. Di Pisquale & D. Matthews, Australia

- 3** Consider pairs of the sequences of positive real numbers

$$a_1 \geq a_2 \geq a_3 \geq \dots, \quad b_1 \geq b_2 \geq b_3 \geq \dots$$

and the sums

$$A_n = a_1 + \dots + a_n, \quad B_n = b_1 + \dots + b_n; \quad n = 1, 2, \dots$$

For any pair define $c_n = \min\{a_i, b_i\}$ and $C_n = c_1 + \dots + c_n, n = 1, 2, \dots$

(1) Does there exist a pair $(a_i)_{i \geq 1}, (b_i)_{i \geq 1}$ such that the sequences $(A_n)_{n \geq 1}$ and $(B_n)_{n \geq 1}$ are unbounded while the sequence $(C_n)_{n \geq 1}$ is bounded?

(2) Does the answer to question (1) change by assuming additionally that $b_i = 1/i, i = 1, 2, \dots$?

Justify your answer.

- 4** Let n be a positive integer and let $x_1 \leq x_2 \leq \dots \leq x_n$ be real numbers. Prove that

$$\left(\sum_{i,j=1}^n |x_i - x_j| \right)^2 \leq \frac{2(n^2 - 1)}{3} \sum_{i,j=1}^n (x_i - x_j)^2.$$

Show that the equality holds if and only if x_1, \dots, x_n is an arithmetic sequence.

- 5** Let \mathbb{R}^+ be the set of all positive real numbers. Find all functions $f : \mathbb{R}^+ \rightarrow \mathbb{R}^+$ that satisfy the following conditions:

- $f(xyz) + f(x) + f(y) + f(z) = f(\sqrt{xy})f(\sqrt{yz})f(\sqrt{zx})$ for all $x, y, z \in \mathbb{R}^+$;
- $f(x) < f(y)$ for all $1 \leq x < y$.

Proposed by Hojoo Lee, Korea

- 6** Let n be a positive integer and let $(x_1, \dots, x_n), (y_1, \dots, y_n)$ be two sequences of positive real numbers. Suppose (z_2, \dots, z_{2n}) is a sequence of positive real numbers such that $z_{i+j}^2 \geq x_i y_j$ for all $1 \leq i, j \leq n$.

Let $M = \max\{z_2, \dots, z_{2n}\}$. Prove that

$$\left(\frac{M + z_2 + \dots + z_{2n}}{2n} \right)^2 \geq \left(\frac{x_1 + \dots + x_n}{n} \right) \left(\frac{y_1 + \dots + y_n}{n} \right).$$

Proposed by Reid Barton, USA

– Combinatorics

- 1** Let A be a 101-element subset of the set $S = \{1, 2, \dots, 1000000\}$. Prove that there exist numbers t_1, t_2, \dots, t_{100} in S such that the sets

$$A_j = \{x + t_j \mid x \in A\}, \quad j = 1, 2, \dots, 100$$

are pairwise disjoint.

- 2** Let D_1, D_2, \dots, D_n be closed discs in the plane. (A closed disc is the region limited by a circle, taken jointly with this circle.) Suppose that every point in the plane is contained in at most 2003 discs D_i . Prove that there exists a disc D_k which intersects at most $7 \cdot 2003 - 1 = 14020$ other discs D_i .

- 3 Let $n \geq 5$ be a given integer. Determine the greatest integer k for which there exists a polygon with n vertices (convex or not, with non-selfintersecting boundary) having k internal right angles.

Proposed by Juozas Juvencijus Macys, Lithuania

- 4 Let x_1, \dots, x_n and y_1, \dots, y_n be real numbers. Let $A = (a_{ij})_{1 \leq i, j \leq n}$ be the matrix with entries

$$a_{ij} = \begin{cases} 1, & \text{if } x_i + y_j \geq 0; \\ 0, & \text{if } x_i + y_j < 0. \end{cases}$$

Suppose that B is an $n \times n$ matrix with entries 0, 1 such that the sum of the elements in each row and each column of B is equal to the corresponding sum for the matrix A . Prove that $A = B$.

- 5 Every point with integer coordinates in the plane is the center of a disk with radius $1/1000$.
- (1) Prove that there exists an equilateral triangle whose vertices lie in different discs.
- (2) Prove that every equilateral triangle with vertices in different discs has side-length greater than 96.

Radu Gologan, Romania

The " ≥ 96 " in (b) can be strengthened to " ≥ 124 ". By the way, part (a) of this problem is the place where I used the well-known "Dedekind" theorem (<http://mathlinks.ro/viewtopic.php?t=5537>).

- 6 Let $f(k)$ be the number of integers n satisfying the following conditions:
- (i) $0 \leq n < 10^k$ so n has exactly k digits (in decimal notation), with leading zeroes allowed;
- (ii) the digits of n can be permuted in such a way that they yield an integer divisible by 11.

Prove that $f(2m) = 10f(2m - 1)$ for every positive integer m .

Proposed by Dirk Laurie, South Africa
