- 1 Let *G* be the centroid of a triangle *ABC*, and *M* be the midpoint of *BC*. Let *X* be on *AB* and *Y* on *AC* such that the points *X*, *Y*, and *G* are collinear and *XY* and *BC* are parallel. Suppose that *XC* and *GB* intersect at *Q* and *YB* and *GC* intersect at *P*. Show that triangle *MPQ* is similar to triangle *ABC*.
- 2 Suppose there are 997 points given in a plane. If every two points are joined by a line segment with its midpoint coloured in red, show that there are at least 1991 red points in the plane. Can you find a special case with exactly 1991 red points?
- **3** Let $a_1, a_2, \dots, a_n, b_1, b_2, \dots, b_n$ be positive real numbers such that $a_1 + a_2 + \dots + a_n = b_1 + b_2 + \dots + b_n$. Show that

 $\frac{a_1^2}{a_1+b_1} + \frac{a_2^2}{a_2+b_2} + \dots + \frac{a_n^2}{a_n+b_n} \ge \frac{a_1+a_2+\dots+a_n}{2}$

4 During a break, *n* children at school sit in a circle around their teacher to play a game. The teacher walks clockwise close to the children and hands out candies to some of them according to the following rule:

He selects one child and gives him a candy, then he skips the next child and gives a candy to the next one, then he skips 2 and gives a candy to the next one, then he skips 3, and so on.

Determine the values of n for which eventually, perhaps after many rounds, all children will have at least one candy each.

5 Given are two tangent circles and a point *P* on their common tangent perpendicular to the lines joining their centres. Construct with ruler and compass all the circles that are tangent to these two circles and pass through the point *P*.
