- 1 For a positive integer n let S(n) be the sum of digits in the decimal representation of n. Any positive integer obtained by removing several (at least one) digits from the right-hand end of the decimal representation of n is called a *stump* of n. Let T(n) be the sum of all stumps of n. Prove that n = S(n) + 9T(n).
- **2** Find the largest positive integer N so that the number of integers in the set $\{1, 2, ..., N\}$ which are divisible by 3 is equal to the number of integers which are divisible by 5 or 7 (or both).
- **3** Two equal-sized regular *n*-gons intersect to form a 2*n*-gon *C*. Prove that the sum of the sides of *C* which form part of one *n*-gon equals half the perimeter of *C*.

Alternative formulation:

Let two equal regular *n*-gons S and T be located in the plane such that their intersection $S \cap T$ is a 2n-gon (with $n \ge 3$). The sides of the polygon S are coloured in red and the sides of T in blue.

Prove that the sum of the lengths of the blue sides of the polygon $S \cap T$ is equal to the sum of the lengths of its red sides.

- **4** A point in the plane with a cartesian coordinate system is called a *mixed point* if one of its coordinates is rational and the other one is irrational. Find all polynomials with real coefficients such that their graphs do not contain any mixed point.
- **5** Find the greatest integer *n*, such that there are n + 4 points *A*, *B*, *C*, *D*, X_1, \ldots, X_n in the plane with $AB \neq CD$ that satisfy the following condition: for each $i = 1, 2, \ldots, n$ triangles ABX_i and CDX_i are equal.
