1 Let $S$ be a set of 9 distinct integers all of whose prime factors are at most 3 . Prove that $S$ contains 3 distinct integers such that their product is a perfect cube.

2 Let $A B C$ be an acute angled triangle with $\angle B A C=60^{\circ}$ and $A B>A C$. Let $I$ be the incenter, and $H$ the orthocenter of the triangle $A B C$. Prove that $2 \angle A H I=3 \angle A B C$.

3 Consider $n$ disks $C_{1} ; C_{2} ; \ldots ; C_{n}$ in a plane such that for each $1 \leq i<n$, the center of $C_{i}$ is on the circumference of $C_{i+1}$, and the center of $C_{n}$ is on the circumference of $C_{1}$. Define the score of such an arrangement of $n$ disks to be the number of pairs $(i ; j)$ for which $C_{i}$ properly contains $C_{j}$. Determine the maximum possible score.
$4 \quad$ Let $x ; y$ and $z$ be positive real numbers such that $\sqrt{x}+\sqrt{y}+\sqrt{z}=1$. Prove that $\frac{x^{2}+y z}{\sqrt{2 x^{2}(y+z)}}+$ $\frac{y^{2}+z x}{\sqrt{2 y^{2}(z+x)}}+\frac{z^{2}+x y}{\sqrt{2 z^{2}(x+y)}} \geq 1$.

5 A regular ( $5 \times 5$ )-array of lights is defective, so that toggling the switch for one light causes each adjacent light in the same row and in the same column as well as the light itself to change state, from on to off, or from off to on. Initially all the lights are switched off. After a certain number of toggles, exactly one light is switched on. Find all the possible positions of this light.
