- 1 The picture below shows the way Juan wants to divide a square field in three regions, so that all three of them share a well at vertex  $B$ . If the side length of the field is 60 meters, and each one of the three regions has the same area, how far must the points  $M$  and  $N$  be from  $D$ ?

Note: the area of each region includes the area the well occupies.

- 2 A series of figures is shown in the picture below, each one of them created by following a secret rule. If the leftmost figure is considered the first figure, how many squares will the 21st figure have?

<http://www.artofproblemsolving.com/Forum/download/file.php?id=49934>

Note: only the little squares are to be counted (i.e., the  $2 \times 2$  squares,  $3 \times 3$  squares, ... should not be counted)

Extra (not part of the original problem): How many squares will the 21st figure have, if we consider all  $1 \times 1$  squares, all  $2 \times 2$  squares, all  $3 \times 3$  squares, and so on?

- 3 In a triangle  $ABC$ , let  $M$  be the midpoint of  $AC$ . If  $BC = \frac{2}{3}MC$  and  $\angle BMC = 2\angle ABM$ , determine  $\frac{AM}{AB}$ .

- 4 Find all 4-digit numbers  $\overline{abcd}$  that are multiples of 11, such that the 2-digit number  $\overline{ac}$  is a

multiple of 7 and  $a + b + c + d = d^2$ .

- 
- 5 In a triangle  $ABC$ , let  $D$ ,  $E$  and  $F$  be the feet of the altitudes from  $A$ ,  $B$  and  $C$  respectively. Let  $D'$ ,  $E'$  and  $F'$  be the second intersection of lines  $AD$ ,  $BE$  and  $CF$  with the circumcircle of  $ABC$ . Show that the triangles  $DEF$  and  $D'E'F'$  are similar.
-
