## Day 1

1 In a scalene triangle $A B C$ with $\angle A=90^{\circ}$, the tangent line at $A$ to its circumcircle meets line $B C$ at $M$ and the incircle touches $A C$ at $S$ and $A B$ at $R$.
The lines $R S$ and $B C$ intersect at $N$, while the lines $A M$ and $S R$ intersect at $U$.
Prove that the triangle $U M N$ is isosceles.
2 For n real numbers $a_{1}, a_{2}, \ldots, a_{n}$, let $d$ denote the difference between the greatest and smallest of them and $S=\sum_{i<j}\left|a_{i}-a_{j}\right|$. Prove that

$$
(n-1) d \leq S \leq \frac{n^{2}}{4} d
$$

and find when each equality holds.
3 The numbers $1,2, \ldots, n^{2}$ are written in the squares of an $n \times n$ board in some order. Initially there is a token on the square labelled with $n^{2}$. In each step, the token can be moved to any adjacent square (by side). At the beginning, the token is moved to the square labelled with the number 1 along a path with the minimum number of steps. Then it is moved to the square labelled with 2 , then to square 3 , etc, always taking the shortest path, until it returns to the initial square. If the total trip takes $N$ steps, find the smallest and greatest possible values of $N$.

## Day 2

1 Find all pairs $(a, b)$ of positive integers such that $2 a-1$ and $2 b+1$ are coprime and $a+b$ divides $4 a b+1$.

2 The sides $A D$ and $C D$ of a tangent quadrilateral $A B C D$ touch the incircle $\varphi$ at $P$ and $Q$, respectively. If $M$ is the midpoint of the chord $X Y$ determined by $\varphi$ on the diagonal $B D$, prove that $\angle A M P=\angle C M Q$.

3 Consider a regular $n$-gon with $n$ odd. Given two adjacent vertices $A_{1}$ and $A_{2}$, define the sequence $\left(A_{k}\right)$ of vertices of the $n$-gon as follows: For $k \geq 3, A_{k}$ is the vertex lying on the perpendicular bisector of $A_{k-2} A_{k-1}$. Find all $n$ for which each vertex of the $n$-gon occurs in this sequence.
