Day 1	September 23rd
1	The integers from 1 to 2008^2 are written on each square of a 2008×2008 board. For every row and column the difference between the maximum and minimum numbers is computed. Let S be the sum of these 4016 numbers. Find the greatest possible value of S.
2	Given a triangle ABC, let r be the external bisector of $\angle ABC$. P and Q are the feet of the perpendiculars from A and C to r. If $CP \cap BA = M$ and $AQ \cap BC = N$, show that MN, r and AC concur.
3	Let $P(x) = x^3 + mx + n$ be an integer polynomial satisfying that if $P(x) - P(y)$ is divisible by 107, then $x - y$ is divisible by 107 as well, where x and y are integers. Prove that 107 divides m.
Day 2	September 24th
4	Prove that the equation $$x^{2008} + 2008! = 21^y$$ doesn't have solutions in integers.
5	Let ABC a triangle and X, Y and Z points at the segments BC, AC and AB, respectively.Let A', B' and C' the circuncenters of triangles AZY,BXZ,CYX, respectively.Prove that $4(A'B'C') \geq (ABC)$ with equality if and only if AA', BB' and CC' are concurrents. Note: (XYZ) denotes the area of XYZ
6	*Biribol* is a game played between two teams of 4 people each (teams are not fixed). Find all the possible values of n for which it is possible to arrange a tournament with n players in such a way that every couple of people plays a match in opposite teams exactly once.
