by N.T.TUAN, rrusczyk

**Day 1**

1 A communications network consisting of some terminals is called a [i]3-connector[/i] if among any three terminals, some two of them can directly communicate with each other. A communications network contains a *windmill* with  $n$  blades if there exist  $n$  pairs of terminals  $\{x_1, y_1\}, \{x_2, y_2\}, \dots, \{x_n, y_n\}$  such that each  $x_i$  can directly communicate with the corresponding  $y_i$  and there is a *hub* terminal that can directly communicate with each of the  $2n$  terminals  $x_1, y_1, \dots, x_n, y_n$ . Determine the minimum value of  $f(n)$ , in terms of  $n$ , such that a 3-connector with  $f(n)$  terminals always contains a windmill with  $n$  blades.

2 In acute triangle  $ABC$ , segments  $AD$ ,  $BE$ , and  $CF$  are its altitudes, and  $H$  is its orthocenter. Circle  $\omega$ , centered at  $O$ , passes through  $A$  and  $H$  and intersects sides  $AB$  and  $AC$  again at  $Q$  and  $P$  (other than  $A$ ), respectively. The circumcircle of triangle  $OPQ$  is tangent to segment  $BC$  at  $R$ . Prove that  $\frac{CR}{BR} = \frac{ED}{FD}$ .

3 Find the least real number  $k$  with the following property: if the real numbers  $x$ ,  $y$ , and  $z$  are not all positive, then

$$k(x^2 - x + 1)(y^2 - y + 1)(z^2 - z + 1) \geq (xyz)^2 - xyz + 1.$$

**Day 2**

4 Let  $n$  be a positive integer. Find, with proof, the least positive integer  $d_n$  which cannot be expressed in the form

$$\sum_{i=1}^n (-1)^{a_i} 2^{b_i},$$

where  $a_i$  and  $b_i$  are nonnegative integers for each  $i$ .

5 Let  $n$  be a given integer with  $n$  greater than 7, and let  $\mathcal{P}$  be a convex polygon with  $n$  sides. Any set of  $n - 3$  diagonals of  $\mathcal{P}$  that do not intersect in the interior of the polygon determine a triangulation of  $\mathcal{P}$  into  $n - 2$  triangles. A triangle in the triangulation of  $\mathcal{P}$  is an interior triangle if all of its sides are diagonals of  $\mathcal{P}$ . Express, in terms of  $n$ , the number of triangulations of  $\mathcal{P}$  with exactly two interior triangles, in closed form.

- 6 Let  $ABC$  be a triangle. Triangles  $PAB$  and  $QAC$  are constructed outside of triangle  $ABC$  such that  $AP = AB$  and  $AQ = AC$  and  $\angle BAP = \angle CAQ$ . Segments  $BQ$  and  $CP$  meet at  $R$ . Let  $O$  be the circumcenter of triangle  $BCR$ . Prove that  $AO \perp PQ$ .
