

**USA Team Selection Test 2007**
[www.artofproblemsolving.com/community/c4637](http://www.artofproblemsolving.com/community/c4637)

by N.T.TUAN, rrusczyk

**Day 1**

- 
- 1** Circles  $\omega_1$  and  $\omega_2$  meet at  $P$  and  $Q$ . Segments  $AC$  and  $BD$  are chords of  $\omega_1$  and  $\omega_2$  respectively, such that segment  $AB$  and ray  $CD$  meet at  $P$ . Ray  $BD$  and segment  $AC$  meet at  $X$ . Point  $Y$  lies on  $\omega_1$  such that  $PY \parallel BD$ . Point  $Z$  lies on  $\omega_2$  such that  $PZ \parallel AC$ . Prove that points  $Q, X, Y, Z$  are collinear.
- 

- 2** Let  $n$  be a positive integer and let  $a_1 \leq a_2 \leq \dots \leq a_n$  and  $b_1 \leq b_2 \leq \dots \leq b_n$  be two nondecreasing sequences of real numbers such that

$$a_1 + \dots + a_i \leq b_1 + \dots + b_i \text{ for every } i = 1, \dots, n$$

and

$$a_1 + \dots + a_n = b_1 + \dots + b_n.$$

Suppose that for every real number  $m$ , the number of pairs  $(i, j)$  with  $a_i - a_j = m$  equals the numbers of pairs  $(k, \ell)$  with  $b_k - b_\ell = m$ . Prove that  $a_i = b_i$  for  $i = 1, \dots, n$ .

---

- 3** Let  $\theta$  be an angle in the interval  $(0, \pi/2)$ . Given that  $\cos \theta$  is irrational, and that  $\cos k\theta$  and  $\cos[(k+1)\theta]$  are both rational for some positive integer  $k$ , show that  $\theta = \pi/6$ .
- 

**Day 2**

- 
- 4** Determine whether or not there exist positive integers  $a$  and  $b$  such that  $a$  does not divide  $b^n - n$  for all positive integers  $n$ .
- 

- 5** Triangle  $ABC$  is inscribed in circle  $\omega$ . The tangent lines to  $\omega$  at  $B$  and  $C$  meet at  $T$ . Point  $S$  lies on ray  $BC$  such that  $AS \perp AT$ . Points  $B_1$  and  $C_1$  lie on ray  $ST$  (with  $C_1$  in between  $B_1$  and  $S$ ) such that  $B_1T = BT = C_1T$ . Prove that triangles  $ABC$  and  $AB_1C_1$  are similar to each other.
- 

- 6** For a polynomial  $P(x)$  with integer coefficients,  $r(2i-1)$  (for  $i = 1, 2, 3, \dots, 512$ ) is the remainder obtained when  $P(2i-1)$  is divided by 1024. The sequence

$$(r(1), r(3), \dots, r(1023))$$

is called the *remainder sequence* of  $P(x)$ . A remainder sequence is called *complete* if it is a permutation of  $(1, 3, 5, \dots, 1023)$ . Prove that there are no more than  $2^{35}$  different complete remainder sequences.
