- **1** The diagonals *AC* and *BD* of a cyclic quadrilateral *ABCD* intersect at *P*. Let *O* be the circumcenter of triangle *APB* and *H* be the orthocenter of triangle *CPD*. Show that the points *H*, *P*, *O* are collinear.
- **2** Let  $p(x) = x^2 + ax + b$  be a quadratic polynomial with  $a, b \in \mathbb{Z}$ . Given any integer n, show that there is an integer M such that p(n)p(n+1) = p(M).

3 If 
$$a, b, c, d \in \mathbb{R}_+$$
 and  $a + b + c + d = 1$ , show that

$$ab + bc + cd \le \frac{1}{4}.$$

- **4** Let *ABC* be a triangle in a plane  $\pi$ . Find the set of all points *P* (distinct from *A*, *B*, *C*) in the plane  $\pi$  such that the circumcircles of triangles *ABP*, *BCP*, *CAP* have the same radii.
- **5** Show that there is a natural number n such that n! when written in decimal notation ends exactly in 1993 zeros.
- **6** Let ABC be a triangle right-angled at A and S be its circumcircle. Let  $S_1$  be the circle touching the lines AB and AC, and the circle S internally. Further, let  $S_2$  be the circle touching the lines AB and AC and the circle S externally. If  $r_1, r_2$  be the radii of  $S_1, S_2$  prove that  $r_1 \cdot r_2 = 4A[ABC]$ .
- 7 Let  $A = \{1, 2, 3, ..., 100\}$  and *B* be a subset of *A* having 53 elements. Show that *B* has 2 distinct elements *x* and *y* whose sum is divisible by 11.
- 8 Let f be a bijective function from  $A = \{1, 2, ..., n\}$  to itself. Show that there is a positive integer M such that  $f^{M}(i) = f(i)$  for each i in A, where  $f^{M}$  denotes the composition  $f \circ f \circ \cdots \circ f M$  times.
- **9** Show that there exists a convex hexagon in the plane such that
  - (i) all its interior angles are equal;
  - (ii) its sides are 1, 2, 3, 4, 5, 6 in some order.
