1 In the diagram line segments $A B$ and $C D$ are of length 1 while angles $A B C$ and $C B D$ are $90^{\circ}$ and $30^{\circ}$ respectively. Find $A C$.

2 A Mathlon is a competition in which there are $M$ athletic events. Such a competition was held in which only $A, B$, and $C$ participated. In each event $p_{1}$ points were awarded for first place, $p_{2}$ for second and $p_{3}$ for third, where $p_{1}>p_{2}>p_{3}>0$ and $p_{1}, p_{2}, p_{3}$ are integers. The final scores for $A$ was 22, for $B$ was 9 and for $C$ was also 9 . $B$ won the 100 metres. What is the value of $M$ and who was second in the high jump?
$3 \quad$ A chord $S T$ of constant length slides around a semicircle with diameter $A B . M$ is the midpoint of $S T$ and $P$ is the foot of the perpendicular from $S$ to $A B$. Prove that $\angle S P M$ is constant for all positions of $S T$.
$4 \quad$ For all positive integers $n$ and $k$, define $F(n, k)=\sum_{r=1}^{n} r^{2 k-1}$. Prove that $F(n, 1)$ divides $F(n, k)$.

5 Let $u_{1}, u_{2}, u_{3}, \ldots$ be a sequence of integers satisfying the recurrence relation $u_{n+2}=u_{n+1}^{2}-u_{n}$. Suppose $u_{1}=39$ and $u_{2}=45$. Prove that 1986 divides infinitely many terms of the sequence.
