- **1** Find all real solutions to the equation $4x^2 40\lfloor x \rfloor + 51 = 0$.
- 2 Let *ABC* be an equilateral triangle of altitude 1. A circle with radius 1 and center on the same side of *AB* as *C* rolls along the segment *AB*. Prove that the arc of the circle that is inside the triangle always has the same length.
- **3** Determine all positive integers n with the property that $n = (d(n))^2$. Here d(n) denotes the number of positive divisors of n.
- 4 Suppose a_1, a_2, \dots, a_8 are eight distinct integers from $\{1, 2, \dots, 16, 17\}$. Show that there is an integer k > 0 such that the equation $a_i a_j = k$ has at least three different solutions. Also, find a specific set of 7 distinct integers from $\{1, 2, \dots, 16, 17\}$ such that the equation $a_i - a_j = k$ does not have three distinct solutions for any k > 0.
- 5 Let x, y, and z be non-negative real numbers satisfying x + y + z = 1. Show that

$$x^2y+y^2z+z^2x\leq \frac{4}{27}$$

and find when equality occurs.
