- 1 An equilateral triangle of side length n is divided into unit triangles. Let f(n) be the number of paths from the triangle in the top row to the middle triangle in the bottom row, such that adjacent triangles in a path share a common edge and the path never travels up (from a lower row to a higher row) or revisits a triangle. An example is shown on the picture for n = 5. Determine the value of f(2005).
- **2** Let (a, b, c) be a Pythagorean triple, i.e. a triplet of positive integers with $a^2 + b^2 = c^2$. *a*) Prove that $\left(\frac{c}{a} + \frac{c}{b}\right)^2 > 8$. *b*) Prove that there are no integer *n* and Pythagorean triple (a, b, c) satisfying $\left(\frac{c}{a} + \frac{c}{b}\right)^2 = n$.
- **3** Let *S* be a set of $n \ge 3$ points in the interior of a circle. *a*) Show that there are three distinct points $a, b, c \in S$ and three distinct points A, B, C on the circle such that *a* is (strictly) closer to *A* than any other point in *S*, *b* is closer to *B* than any other point in *S* and *c* is closer to *C* than any other point in *S*. *b*) Show that for no value of *n* can four such points in *S* (and corresponding points on the circle) be guaranteed.
- 4 Let *ABC* be a triangle with circumradius *R*, perimeter *P* and area *K*. Determine the maximum value of: $\frac{KP}{R^3}$.
- **5** Let's say that an ordered triple of positive integers (a, b, c) is [i]*n*-powerful[/i] if $a \le b \le c$, gcd(a, b, c) = 1 and $a^n + b^n + c^n$ is divisible by a + b + c. For example, (1, 2, 2) is 5-powerful. *a*) Determine all ordered triples (if any) which are *n*-powerful for all $n \ge 1$. *b*) Determine all ordered triples (if any) which are 2004-powerful and 2005-powerful, but not 2007-powerful.
