---

**1** Let  $a_1, a_2, \dots, a_n$  be positive real numbers whose product is 1. Show that the sum

$$\frac{a_1}{1+a_1} + \frac{a_2}{(1+a_1)(1+a_2)} + \frac{a_3}{(1+a_1)(1+a_2)(1+a_3)} + \cdots + \frac{a_n}{(1+a_1)(1+a_2)\cdots(1+a_n)}$$

is greater than or equal to  $\frac{2^n - 1}{2^n}$ .

---

**2** Let  $m$  and  $n$  be odd positive integers. Each square of an  $m$  by  $n$  board is coloured red or blue. A row is said to be red-dominated if there are more red squares than blue squares in the row. A column is said to be blue-dominated if there are more blue squares than red squares in the column. Determine the maximum possible value of the number of red-dominated rows plus the number of blue-dominated columns. Express your answer in terms of  $m$  and  $n$ .

---

**3** Let  $p$  be a fixed odd prime. A  $p$ -tuple  $(a_1, a_2, a_3, \dots, a_p)$  of integers is said to be *good* if

- (i)  $0 \leq a_i \leq p - 1$  for all  $i$ , and
- (ii)  $a_1 + a_2 + a_3 + \cdots + a_p$  is not divisible by  $p$ , and
- (iii)  $a_1 a_2 + a_2 a_3 + a_3 a_4 + \cdots + a_p a_1$  is divisible by  $p$ .

Determine the number of good  $p$ -tuples.

---

**4** The quadrilateral  $ABCD$  is inscribed in a circle. The point  $P$  lies in the interior of  $ABCD$ , and  $\angle PAB = \angle PBC = \angle PCD = \angle PDA$ . The lines  $AD$  and  $BC$  meet at  $Q$ , and the lines  $AB$  and  $CD$  meet at  $R$ . Prove that the lines  $PQ$  and  $PR$  form the same angle as the diagonals of  $ABCD$ .

---

**5** Fix positive integers  $n$  and  $k \geq 2$ . A list of  $n$  integers is written in a row on a blackboard. You can choose a contiguous block of integers, and I will either add 1 to all of them or subtract 1 from all of them. You can repeat this step as often as you like, possibly adapting your selections based on what I do. Prove that after a finite number of steps, you can reach a state where at least  $n - k + 2$  of the numbers on the blackboard are all simultaneously divisible by  $k$ .
