by jred

**Day 1**

- 
- 1 Find a triple  $(l, m, n)$  of positive integers  $(1 < l < m < n)$ , such that  $\sum_{k=1}^l k, \sum_{k=l+1}^m k, \sum_{k=m+1}^n k$  form a geometric sequence in order.

---

  - 2 The incircle  $I$  of  $\triangle ABC$  is tangent to sides  $AB, BC, CA$  at  $D, E, F$  respectively. Line  $EF$  intersects lines  $AI, BI, DI$  at  $M, N, K$  respectively. Prove that  $DM \cdot KE = DN \cdot KF$ .

---

  - 3 For composite number  $n$ , let  $f(n)$  denote the sum of the least three divisors of  $n$ , and  $g(n)$  the sum of the greatest two divisors of  $n$ . Find all composite numbers  $n$ , such that  $g(n) = (f(n))^m$  ( $m \in \mathbb{N}^*$ ).

---

  - 4 Let  $a, b, c, d$  be real numbers satisfying inequality  $a \cos x + b \cos 2x + c \cos 3x + d \cos 4x \leq 1$  holds for arbitrary real number  $x$ . Find the maximal value of  $a + b - c + d$  and determine the values of  $a, b, c, d$  when that maximum is attained.

**Day 2**

- 
- 1 A nonnegative integer  $m$  is called a six-composited number if  $m$  and the sum of its digits are both multiples of 6. How many six-composited numbers that are less than 2012 are there?

---

  - 2 Find the least natural number  $n$ , such that the following inequality holds:  $\sqrt{\frac{n-2011}{2012}} - \sqrt{\frac{n-2012}{2011}} < \sqrt[3]{\frac{n-2013}{2011}} - \sqrt[3]{\frac{n-2011}{2013}}$ .

---

  - 3 In  $\triangle ABC$ , point  $D$  lies on side  $AC$  such that  $\angle ABD = \angle C$ . Point  $E$  lies on side  $AB$  such that  $BE = DE$ .  $M$  is the midpoint of segment  $CD$ . Point  $H$  is the foot of the perpendicular from  $A$  to  $DE$ . Given  $AH = 2 - \sqrt{3}$  and  $AB = 1$ , find the size of  $\angle AME$ .

---

  - 4 Let positive integers  $m, n$  satisfy  $n = 2^m - 1$ .  $P_n = \{1, 2, \dots, n\}$  is a set that contains  $n$  points on an axis. A grasshopper on the axis can leap from one point to another adjacent point. Find the maximal value of  $m$  satisfying following conditions:
    - (a)  $x, y$  are two arbitrary points in  $P_n$ ;
    - (b) starting at point  $x$ , the grasshopper leaps 2012 times and finishes at point  $y$ ; (the grasshopper is allowed to travel  $x$  and  $y$  more than once)
    - (c) there are even number ways for the grasshopper to do (b).
