by john111111

- 1 Solve in positive integers the following equation; $xy(x + y - 10) - 3x^2 - 2y^2 + 21x + 16y = 60$

- 2 Consider 111 distinct points which lie on or in the internal of a circle with radius 1. Prove that there are at least 1998 segments formed by these points with length $\leq \sqrt{3}$

- 3 Let ABC be an acute triangle with $AB < AC < BC$ inscribed in circle $c(O, R)$. The excircle (c_A) has center I and touches the sides BC, AC, AB of the triangle ABC at D, E, Z respectively. AI cuts (c) at point M and the circumcircle (c_1) of triangle AZE cuts (c) at K . The circumcircle (c_2) of the triangle OKM cuts (c_1) at point N . Prove that the point of intersection of the lines AN, KI lies on (c) .

- 4 Find all functions $f : \mathbb{R} \rightarrow \mathbb{R}$ which satisfy $yf(x) + f(y) \geq f(xy)$
