 – **Day 1** April 18th

**1** For each positive integer  $n$ , find the number of  $n$ -digit positive integers that satisfy both of the following conditions:

- no two consecutive digits are equal, and
- the last digit is a prime.

**2** Let  $a, b, c$  be positive real numbers such that  $a + b + c = 4\sqrt[3]{abc}$ . Prove that

$$2(ab + bc + ca) + 4 \min(a^2, b^2, c^2) \geq a^2 + b^2 + c^2.$$

**3** Let  $ABCD$  be a quadrilateral inscribed in circle  $\omega$  with  $\overline{AC} \perp \overline{BD}$ . Let  $E$  and  $F$  be the reflections of  $D$  over lines  $BA$  and  $BC$ , respectively, and let  $P$  be the intersection of lines  $BD$  and  $EF$ . Suppose that the circumcircle of  $\triangle EPD$  meets  $\omega$  at  $D$  and  $Q$ , and the circumcircle of  $\triangle FPD$  meets  $\omega$  at  $D$  and  $R$ . Show that  $EQ = FR$ .

 – **Day 2** April 19th

**4** Triangle  $ABC$  is inscribed in a circle of radius 2 with  $\angle ABC \geq 90^\circ$ , and  $x$  is a real number satisfying the equation  $x^4 + ax^3 + bx^2 + cx + 1 = 0$ , where  $a = BC$ ,  $b = CA$ ,  $c = AB$ . Find all possible values of  $x$ .

**5** Let  $p$  be a prime, and let  $a_1, \dots, a_p$  be integers. Show that there exists an integer  $k$  such that the numbers

$$a_1 + k, a_2 + 2k, \dots, a_p + pk$$

produce at least  $\frac{1}{2}p$  distinct remainders upon division by  $p$ .

*Proposed by Ankan Bhattacharya*

**6** Karl starts with  $n$  cards labeled  $1, 2, 3, \dots, n$  lined up in a random order on his desk. He calls a pair  $(a, b)$  of these cards *swapped* if  $a > b$  and the card labeled  $a$  is to the left of the card labeled  $b$ . For instance, in the sequence of cards  $3, 1, 4, 2$ , there are three swapped pairs of cards,  $(3, 1)$ ,  $(3, 2)$ , and  $(4, 2)$ .

He picks up the card labeled 1 and inserts it back into the sequence in the opposite position: if the card labeled 1 had  $i$  card to its left, then it now has  $i$  cards to its right. He then picks up

the card labeled 2 and reinserts it in the same manner, and so on until he has picked up and put back each of the cards  $1, 2, \dots, n$  exactly once in that order. (For example, the process starting at  $3, 1, 4, 2$  would be  $3, 1, 4, 2 \rightarrow 3, 4, 1, 2 \rightarrow 2, 3, 4, 1 \rightarrow 2, 4, 3, 1 \rightarrow 2, 3, 4, 1$ .)

Show that, no matter what lineup of cards Karl started with, his final lineup has the same number of swapped pairs as the starting lineup.
