- Day 1

1 In how many ways can one arrange seven white and five black balls in a line in such a way that there are no two neighboring black balls?

2 If $a$ and $b$ are positive integers, prove that $11 a+2 b$ is a multiple of 19 if and only if so is $18 a+5 b$

3 Two externally tangent circles with different radii are given. Their common tangents form a triangle. Find the area of this triangle in terms of the radii of the two circles.

4 In how many ways can one select eight integers $a_{1}, a_{2}, \ldots, a_{8}$, not necesarily distinct, such that $1 \leq a_{1} \leq \ldots \leq a_{8} \leq 8$ ?

- Day 2

5 If $a$ and $b$ are coprime positive integers and $n$ an integer, prove that the greatest common divisor of $a^{2}+b^{2}-n a b$ and $a+b$ divides $n+2$.

6 Consider two fixed points $B, C$ on a circle $w$. Find the locus of the incenters of all triangles $A B C$ when point $A$ describes $w$.

7 Two disjoint subsets of the set $\{1,2, \ldots, m\}$ have the same sums of elements. Prove that each of the subsets $A, B$ has less than $m / \sqrt{2}$ elements.

8 Compute the volume of a regular octahedron circumscribed about a sphere of radius 1.
